## Today

15 Dic 2016

- GenericTree see [Trees chapter \(trees.html\)](#)

## See you

And then, for the lab part:

Date	Hour	Topic
Thursday 15 Dec	9:00-11:00	Trees
Monday 19 Dec	16:00-18:00	Graphs
<b>Wednesday 21 Dec</b>	<b>14:00-16:00</b>	<b>Exam simulation</b>
Thursday 22 Dec	9:00-11:00	String algos / Exam simulation discussion
<b>Thursday 12 Jan</b>	<b>TBD</b>	<b>Lab midterm</b>

## Course website

### Theory

See Alberto Montresor website:

<http://cricca.disi.unitn.it/montresor/teaching/scientific-programming>  
(<http://cricca.disi.unitn.it/montresor/teaching/scientific-programming>)

### Lab

[davidleoni.github.io/algolab](http://davidleoni.github.io/algolab) (<https://davidleoni.github.io/algolab>)

# Chapters

Worksheets are meant to be used online - pdf quality is not very good, if they result unreadable please tell me

0. [Testing \(testing.html\)](#) (pdf (pdf/testing.pdf))
1. [Lists \(lists.html\)](#) (pdf (pdf/lists.pdf))
2. [Data Structures \(data-structures.html\)](#) (pdf (pdf/data-structures.pdf))
3. [Trees \(trees.html\)](#) (pdf (pdf/trees.pdf))

## Commandments

**WARNING: If you don't follow the Commandments, bad things happen!**

### 1) You shall test!

To run tests, enter the following command in the terminal:

```
python -m unittest my-file
```

**WARNING: In the call above, DON'T append the extension *.py* to *my-file***  
**WARNING: Still, on the hard-disk the file MUST be named with a *.py* at the end, like *my-file.py***

### 2. You shall also write on paper!

### 3. You shall copy *\*exactly the same\** function definitions as in the exercises!

For example don't write :

```
def MY_selection_sort(A):
```

### 4. You shall never ever reassign function parameters:

```
def myfun(i, s, L, D):
```

```
    # You shall not do any of such evil, no matter what the type of the parameter is:
    i = 666          # basic types (int, float, ...)
    s = "666"        # strings
    L = [666]         # containers
    D = {"evil":666}  # dictionaries

    # For the sole case of composite parameters like lists or dictionaries,
    # you can write stuff like this IF AND ONLY IF the function specification
    # requires you to modify the parameter internal elements (i.e. sorting a list
    # or changing a dictionary field):

    L[4] = 2          # list
    D.my_field = 5     # dictionary
```

5. You shall use **return** command only if you see written **return** in the pseudocode!

If there is no **return** in the pseudocode, the function is intended to return **None**. In this case you don't even need to write **return None**, as Python will do it implicitly for you.

## Slides

### Lab 1 Slides

3 Nov 2016

#### Lab Goals

- Going from theory taught by Prof. Alberto Montresor to implementation
- Pseudo code --> Python

#### How

- Hands-on approach
- Performance considerations
- Focus on correct code
- Few Python functions

#### Lab Midterm?

Probably not. Still, will provide exam example.

### Lab 2 Slides

Date: Nov 11th, 2016

- More practical than last time!
- Finish `selection_sort` and `gap` implementation
- midlab pause ;-)
- implement a Python class

## Lab 3 Slides

Nov 17th, 2016

- Recursion
  - gap\_rec, binary\_search\_rec
- binary\_search\_iter
- Will give you more tests
- Write also on paper!
- Copy *exactly the same* function definitions!
  - For example don't write `def MY_selection_sort(A):`
- use return command *only* if you see written return in the pseudocode!
  - If there is no return in the pseudocode, the function is intended to return None. In this case you don't even need to write `return None`, as Python will do it implicitly for you.

## Lab 4 Slides

Nov 18th, 2016

- Divide et Impera
  - binary\_search\_iter
- Implement ComplexNumber

New Commandment:

You shall never ever reassign function parameters:

```
def myfun(L, i, s):  
  
    # You shall not do any of this evil:  
    L = [666]  
    i = 666  
    s = "666"
```

Previous commandments:

- You shall also write on paper!
- You shall copy exactly the same function definitions as in the exercises!
- For example don't write `def MY_selection_sort(A):`
- You shall use return command only if you see Written return in the pseudocode!
- If there is no return in the pseudocode, the function is intended to return None. In this case you don't even need to write `return None`, as Python will do it implicitly for you.

## Lab 5 slides

24 Nov 2016

- Implement ComplexNumber
- Implement Stack

## Lab 6 slides

1 Dic 2016

- Implement CappedStack
- Implement UnorderedList

## Lab 7 slides

- UnorderedList

## Lab 8 slides

- will start writing tests (will be required during exams)
- invariants in particular
- `UnorderedList` until `fast size()` and `append()` included

## Office hours

You can schedule a meeting by emailing me at david.leoni [AT] unitn.it , more or less I'm available every day until 19.00

Then you will find me in Povo 1 building at DISI, in room 225 DKM :

## Resources

- Online book: Problem Solving with Algorithms and Data Structures using Python (<http://interactivepython.org/runestone/static/pythonds/index.html>) by Brad Miller and David Ranum
- Theory slides (<http://cricca.disi.unitn.it/montresor/teaching/scientific-programming/slides/>) by Alberto Montresor
- Will try to be consistent with other lab module notes (<http://disi.unitn.it/~teso/courses/sciprog/index.html>) of Stefano Teso and Toma Tebaldi
- PythonTutor (<http://www.pythontutor.com/visualize.html#mode=edit>), a visual virtual machine (*very useful!* can also be found in examples inside the book!)
- Source code (<https://github.com/DavidLeoni/algolab>) of these worksheets (download zip (<https://github.com/DavidLeoni/algolab/archive/master.zip>)), in Jupyter Notebook (<http://jupyter.org>) format.
- The internet ....

## Editors

- Jupyter Notebook (<http://jupyter.org>): Nice environment to execute Python commands and display results like graphs. Allows to include documentation in Markdown format
- Spyder (<https://pythonhosted.org/spyder/>): Should be a fine editor, although I haven't used it in a long time
